For this reason, there are special display drivers: They will allow running your terminal software on a display that has a different resolution than the one it was originally. The present invention relates generally to a suture anchor, and particularly to an all-polymer suture anchor with a design that inhibits suture migration. Various techniques are known for the fixation of soft tissues to bone. Many of these techniques involve the placement of sutures, tying knots in the sutures, and tying knots in multiple layers of sutures. These techniques may lead to a variety of complications. These include, for example, tissue impingement by the knots, suture breakage, and poor long-term knot security. The knotless methods, while eliminating many of the above problems, generally involve tying a knot in each end of a suture. A minimally invasive tissue fixation device that is used to anchor soft tissues to bone includes an eyelet and a suture. The suture typically includes a strand of suture material and a suture anchor. The suture anchor is designed to penetrate bone, and to maintain the suture in position such that the suture interacts with tissue. Tension in the suture causes the suture to become embedded in the tissue, and prevents the tissue from slipping or sliding back away from the bone, as the material surrounding the suture is compressed. The suture anchor of the present invention includes a housing that extends into a bone, and a suture extending from the housing. The suture anchor is designed to be used for anchoring soft tissues to bone. The suture anchor includes a suture body, and a suture body having two ends. The suture body preferably includes a material having a hardness less than the hardness of bone. The suture body includes a suture end portion, and a pair of threading portions. The suture body includes a threading portion, a groove, and a pair of thread engaging portions. The two ends of the suture anchor extend into the bone, and the suture extends outside the suture anchor. The suture is provided to interact with tissue, and can be used to hold tissue in position against a bone. The suture has a suture thread, which extends through the suture body. The suture thread preferably is bioabsorbable, and the suture body can be made from a bioabsorbable material.
